

The Phoenix Crane System

1-888-CRANIUM

A modern, state of the art camera crane has one deciding advantage: The fact that working with it is not considered a strain but a positive experience. It gives one the feeling of comfort and security. These are some of the qualities that make the Phoenix Crane the perfect instrument for remote or on board crane operation. The Phoenix is a real all rounder designed to meet the high demands of modern film and TV production, enabling the user to set his or her ideas and wishes into motion. The principle of the Phoenix Crane system is to provide one crane which can be used under a wide range of operational conditions i.e. studio, on

location, with remote head systems or on board camera operators. It's easy set-up and breakdown is possible without tools. The result is that your ideas and imagination knows no bounds.

The Phoenix Crane system's modular design, lightweight sections plus individual components that are equipped with a patented self locking system, result in the fact that the crane may be set-up by two persons in a matter of minutes.

With one crane system you can achieve a range of heights and lengths for which you would normally need to use a variety of different cranes.

The Phoenix Crane is safety type tested according to the European Community guidelines by the TÜV (Technical Surveillance Association) Bavaria and Saxony and is accordingly approved and certified.
